

William Stallings

Computer Organization and Architecture

Chapter 8

Computer Arithmetic

Arithmetic & Logic Unit

- ⌘ Does the calculations
- ⌘ Everything else in the computer is there to service this unit
- ⌘ Handles integers
- ⌘ May handle floating point (real) numbers
- ⌘ May be separate FPU (maths co-processor)
- ⌘ May be on chip separate FPU (486DX +)

ALU Inputs and Outputs

Integer Representation

- ⌘ Only have 0 & 1 to represent everything
- ⌘ Positive numbers stored in binary
 - ☒ e.g. $41 = 00101001$
- ⌘ No minus sign
- ⌘ No period
- ⌘ Sign-Magnitude
- ⌘ Two's compliment

Sign-Magnitude

⌘ Left most bit is sign bit

⌘ 0 means positive

⌘ 1 means negative

⌘ $+18 = 00010010$

⌘ $-18 = 10010010$

⌘ Problems

☒ Need to consider both sign and magnitude in arithmetic

☒ Two representations of zero (+0 and -0)

Two's Complement

$$\text{⌘} + 3 = 00000011$$

$$\text{⌘} + 2 = 00000010$$

$$\text{⌘} + 1 = 00000001$$

$$\text{⌘} + 0 = 00000000$$

$$\text{⌘} - 1 = 11111111$$

$$\text{⌘} - 2 = 11111110$$

$$\text{⌘} - 3 = 11111101$$

Benefits

- ⌘ One representation of zero
- ⌘ Arithmetic works easily (see later)
- ⌘ Negating is fairly easy
 - ☑ $3 = 00000011$
 - ☑ Boolean complement gives 11111100
 - ☑ Add 1 to LSB 11111101

Geometric Depiction of Twos Complement Integers

(a) 4-bit numbers

(b) n-bit numbers

Negation Special Case 1

⌘ 0 = 00000000

⌘ Bitwise not 11111111

⌘ Add 1 to LSB +1

⌘ Result 1 00000000

⌘ Overflow is ignored, so:

⌘ - 0 = 0 ✓

Negation Special Case 2

⌘ -128 = 10000000

⌘ bitwise not 01111111

⌘ Add 1 to LSB +1

⌘ Result 10000000

⌘ So:

⌘ $-(-128) = -128$ X

⌘ Monitor MSB (sign bit)

⌘ It should change during negation

Range of Numbers

⌘ 8 bit 2s compliment

$$\boxed{\wedge} +127 = 01111111 = 2^7 - 1$$

$$\boxed{\wedge} -128 = 10000000 = -2^7$$

⌘ 16 bit 2s compliment

$$\boxed{\wedge} +32767 = 011111111 11111111 = 2^{15} - 1$$

$$\boxed{\wedge} -32768 = 100000000 00000000 = -2^{15}$$

Conversion Between Lengths

⌘ Positive number pack with leading zeros

⌘ +18 = 00010010

⌘ +18 = 00000000 00010010

⌘ Negative numbers pack with leading ones

⌘ -18 = 10010010

⌘ -18 = 11111111 10010010

⌘ i.e. pack with MSB (sign bit)

Addition and Subtraction

- ⌘ Normal binary addition

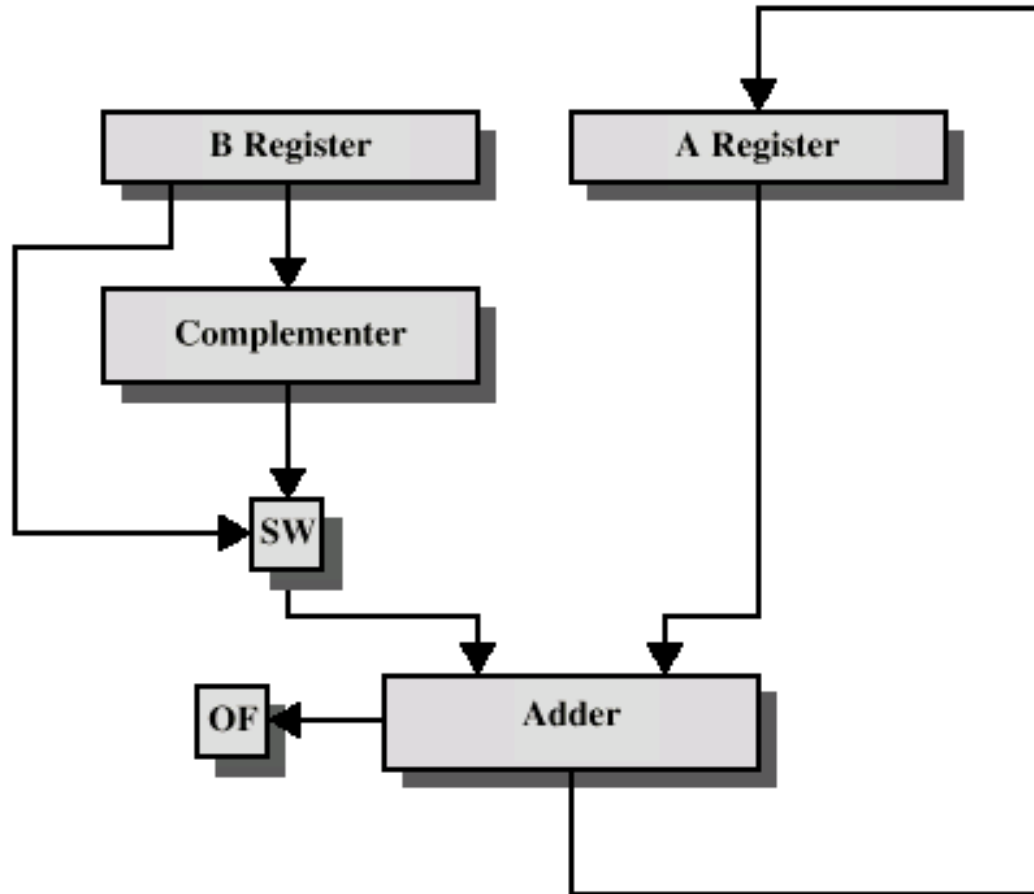

- ⌘ Monitor sign bit for overflow

- ⌘ Take twos compliment of subtrahend and add to minuend

 - ☑ i.e. $a - b = a + (-b)$

- ⌘ So we only need addition and complement circuits

Hardware for Addition and Subtraction

OF = overflow bit

SW = Switch (select addition or subtraction)

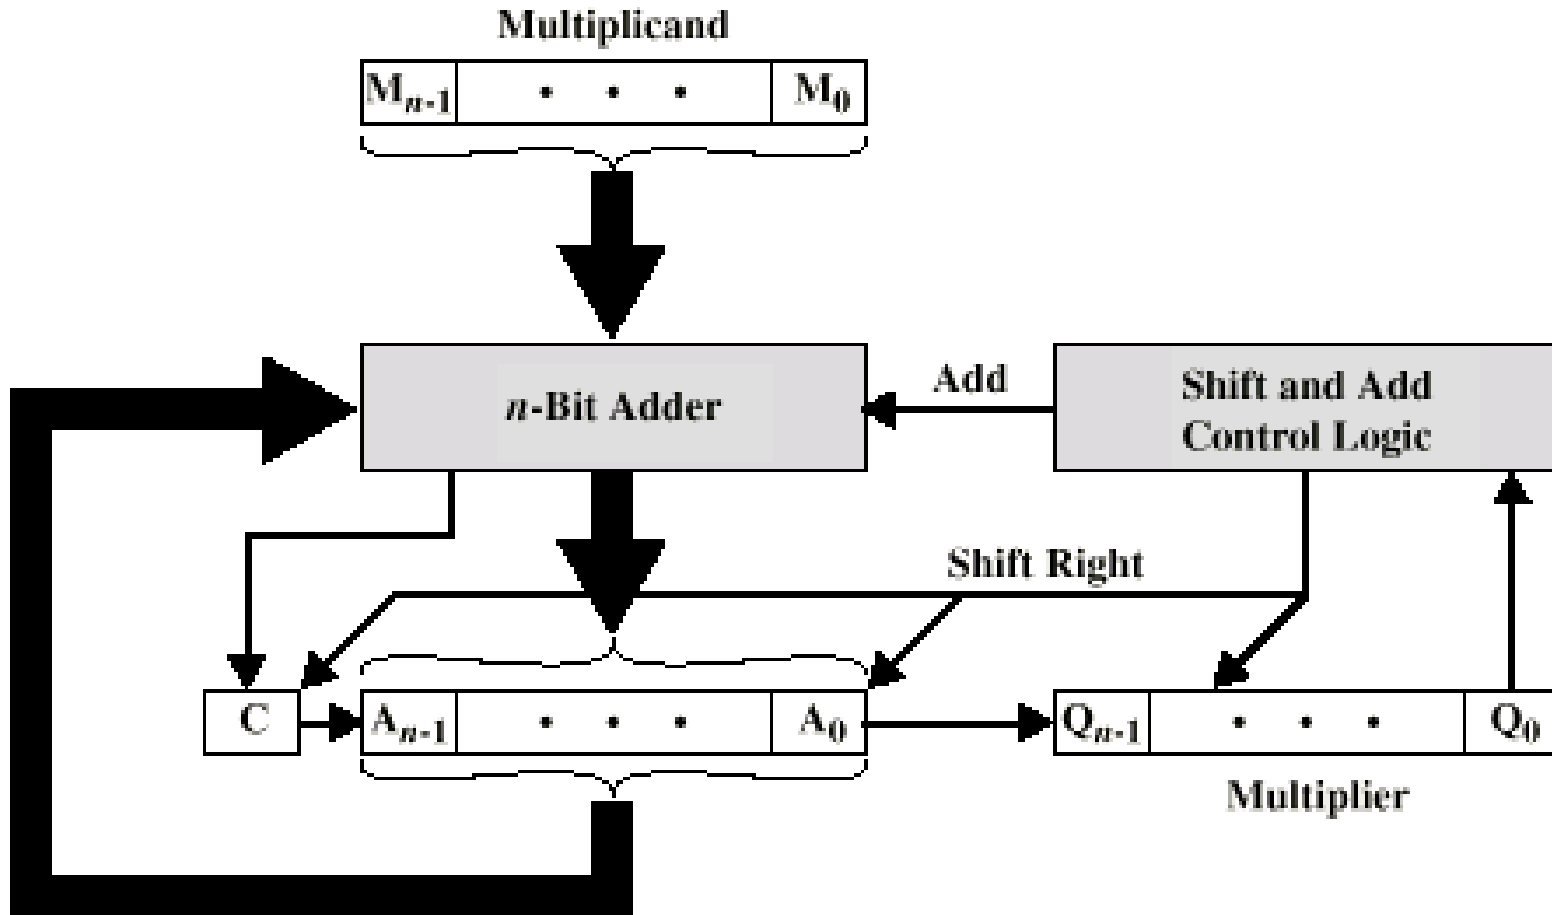

Multiplication

- ⌘ Complex
- ⌘ Work out partial product for each digit
- ⌘ Take care with place value (column)
- ⌘ Add partial products

Multiplication Example

- ⌘ 1011 Multiplicand (11 dec)
- ⌘ 1101 Multiplier (13 dec)
- ⌘ $\begin{array}{r} \hline 1011 \end{array}$ Partial products
- ⌘ 0000 Note: if multiplier bit is 1 copy
- ⌘ 1011 multiplicand (place value)
- ⌘ 1011 otherwise zero
- ⌘ $\begin{array}{r} \hline 10001111 \end{array}$ Product (143 dec)
- ⌘ Note: need double length result

Unsigned Binary Multiplication

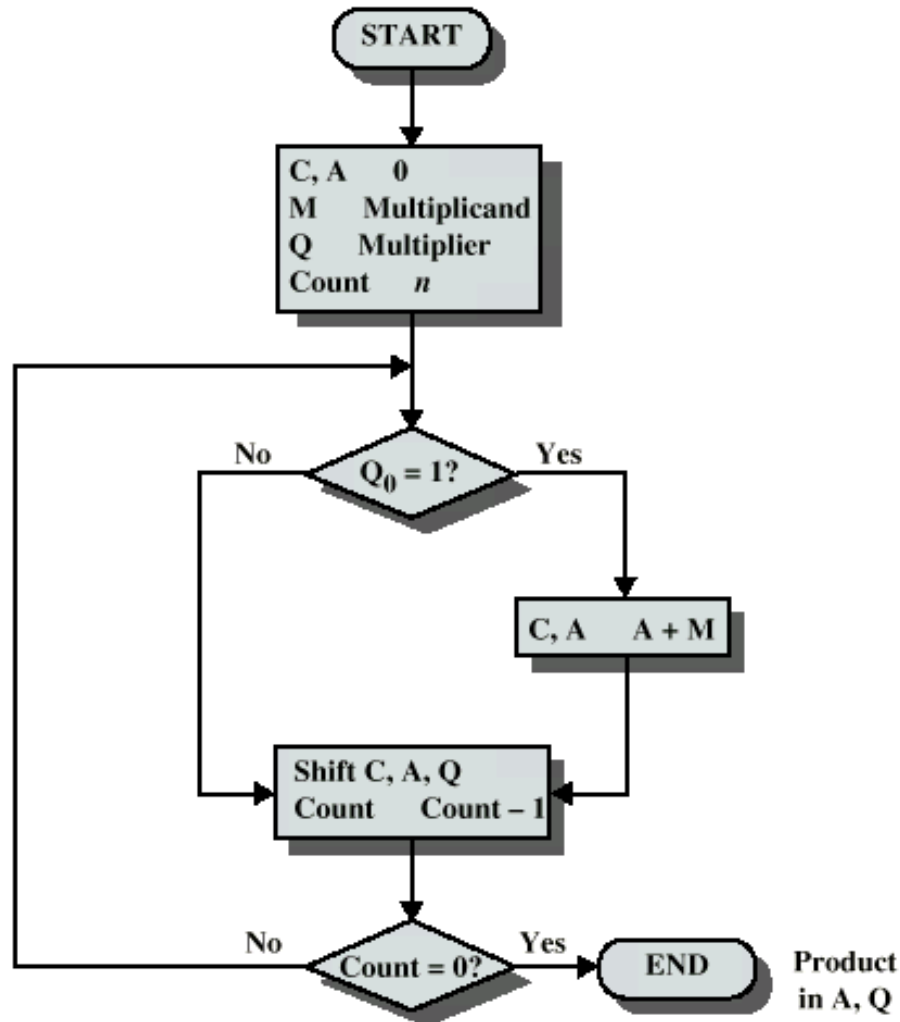

(a) Block Diagram

Execution of Example

C	A	Q	M		
0	0000	1101	1011	Initial Values	
0	1011	1101	1011	Add	} First Cycle
0	0101	1110	1011	Shift	
0	0010	1111	1011	Shift	} Second Cycle
0	1101	1111	1011	Add	
0	0110	1111	1011	Shift	} Third Cycle
1	0001	1111	1011	Add	
0	1000	1111	1011	Shift	} Fourth Cycle

Flowchart for Unsigned Binary Multiplication

Multiplying Negative Numbers

⌘ This does not work!

⌘ Solution 1

- ☑ Convert to positive if required

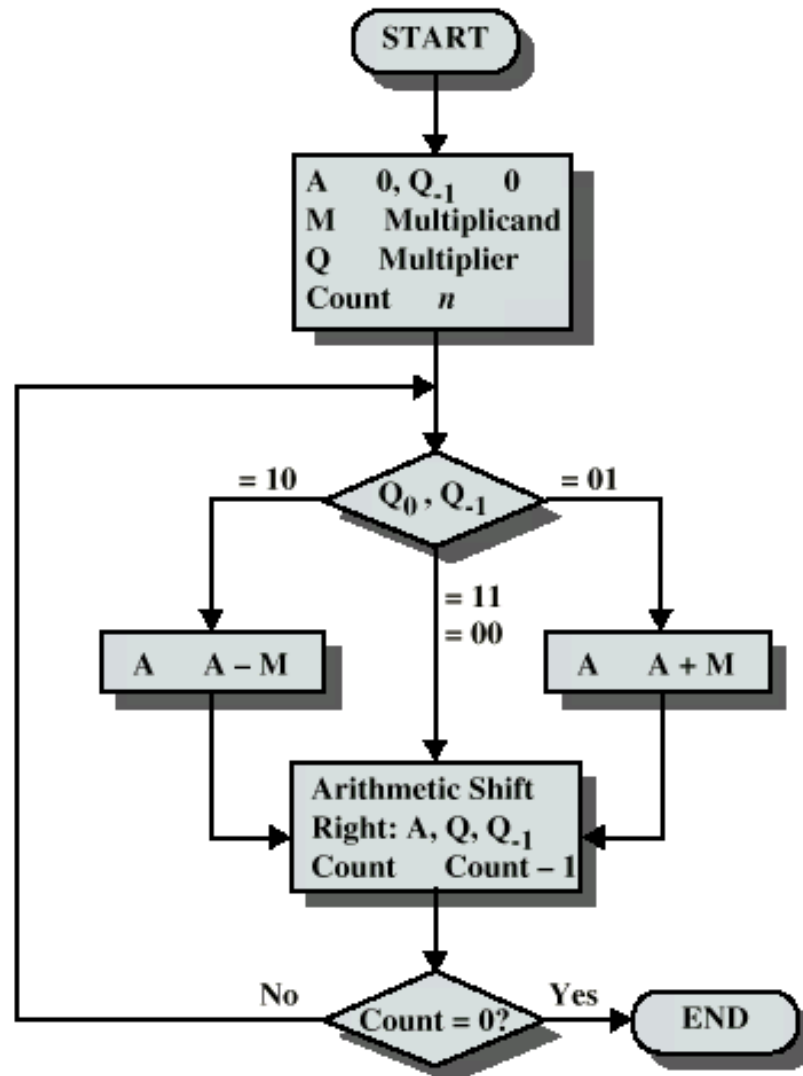

- ☑ Multiply as above

- ☑ If signs were different, negate answer

⌘ Solution 2

- ☑ Booth's algorithm

Booth's Algorithm

Example of Booth's Algorithm

A	Q	Q ₋₁	M		
0000	0011	0	0111	Initial Values	
1001	0011	0	0111	A	} First Cycle
1100	1001	1	0111	A - M Shift	
1110	0100	1	0111	Shift	} Second Cycle
0101	0100	1	0111	A	
0010	1010	0	0111	A + M Shift	} Third Cycle
0001	0101	0	0111	Shift	
					} Fourth Cycle

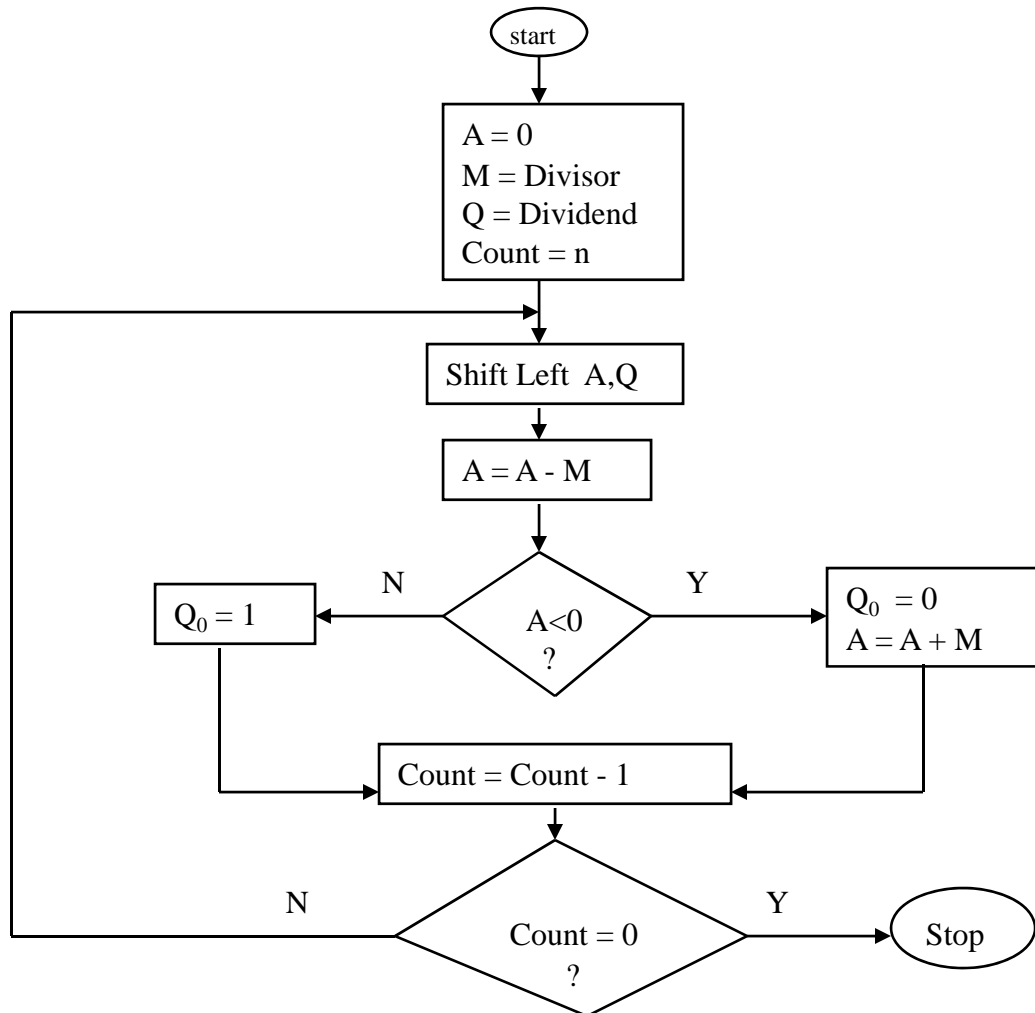

Division

- ⌘ More complex than multiplication
- ⌘ Negative numbers are really bad!
- ⌘ Based on long division

Division of Unsigned Binary Integers

Division Algorithm

Example

A	Q	M = 0011
0000	0111	Initial value
0000	1110	Shift
1101		Subtract
0000	1110	Restore
0001	1100	Shift
1110		Subtract
0001	1100	Restore
0011	1000	Shift
0000		Subtract
0000	1001	Set $Q_0 = 1$
0001	0010	Shift
1110		Subtract
0001	0010	Restore

Real Numbers

⌘ Numbers with fractions

⌘ Could be done in pure binary

☑ $1001.1010 = 2^4 + 2^0 + 2^{-1} + 2^{-3} = 9.625$

⌘ Where is the binary point?

⌘ Fixed?

☑ Very limited

⌘ Moving?

☑ How do you show where it is?

Floating Point

Sign bit	Biased Exponent	Significand or Mantissa
----------	-----------------	-------------------------

⌘ $+/- \text{.significand} \times 2^{\text{exponent}}$

⌘ Misnomer

⌘ Point is actually fixed between sign bit and body of mantissa

⌘ Exponent indicates place value (point position)

Floating Point Examples

(a) Format

0.11010001	2^{10100}	=	0	10010011	101000100000000000000000
-0.11010001	2^{10100}	=	1	10010011	101000100000000000000000
0.11010001	2^{-10100}	=	0	01101011	101000100000000000000000
-0.11010001	2^{-10100}	=	1	01101011	101000100000000000000000

(b) Examples

Signs for Floating Point

⌘ Mantissa is stored in 2s compliment

⌘ Exponent is in excess or biased notation

☑ e.g. Excess (bias) 128 means

☑ 8 bit exponent field

☑ Pure value range 0-255

☑ Subtract 128 to get correct value

☑ Range -128 to +127

Normalization

- ⌘ FP numbers are usually normalized
- ⌘ i.e. exponent is adjusted so that leading bit (MSB) of mantissa is 1
- ⌘ Since it is always 1 there is no need to store it
- ⌘ (c.f. Scientific notation where numbers are normalized to give a single digit before the decimal point
- ⌘ e.g. 3.123×10^3)

FP Ranges

⌘ For a 32 bit number

☑ 8 bit exponent

☑ +/- $2^{256} \approx 1.5 \times 10^{77}$

⌘ Accuracy

☑ The effect of changing lsb of mantissa

☑ 23 bit mantissa $2^{-23} \approx 1.2 \times 10^{-7}$

☑ About 6 decimal places

Expressible Numbers

(a) Twos Complement Integers

(b) Floating-Point Numbers

IEEE 754

- ⌘ Standard for floating point storage
- ⌘ 32 and 64 bit standards
- ⌘ 8 and 11 bit exponent respectively
- ⌘ Extended formats (both mantissa and exponent) for intermediate results

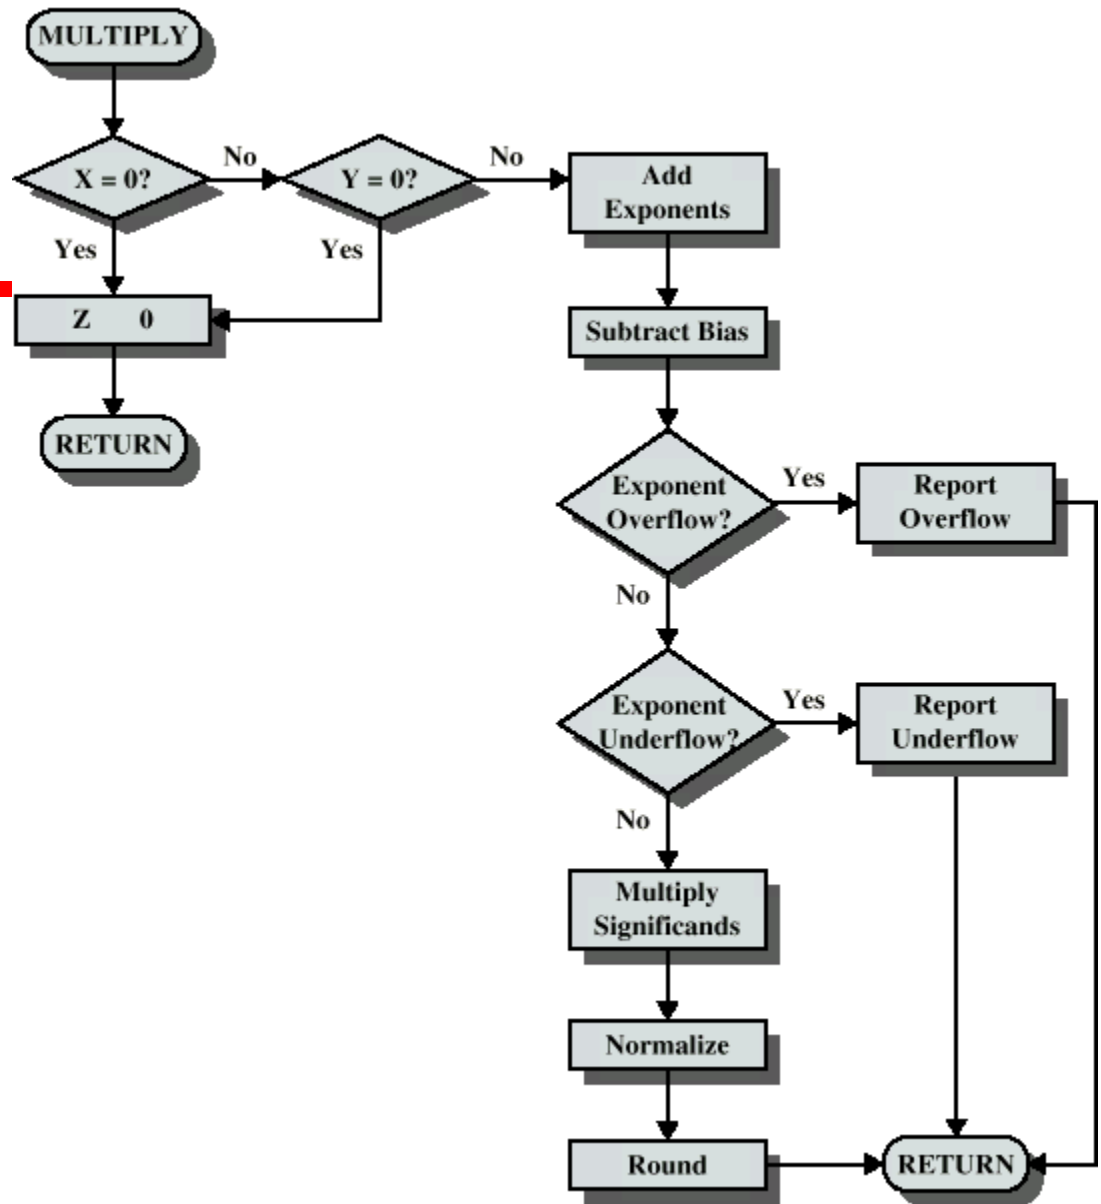

FP Arithmetic +/-

- ⌘ Check for zeros
- ⌘ Align significands (adjusting exponents)
- ⌘ Add or subtract significands
- ⌘ Normalize result

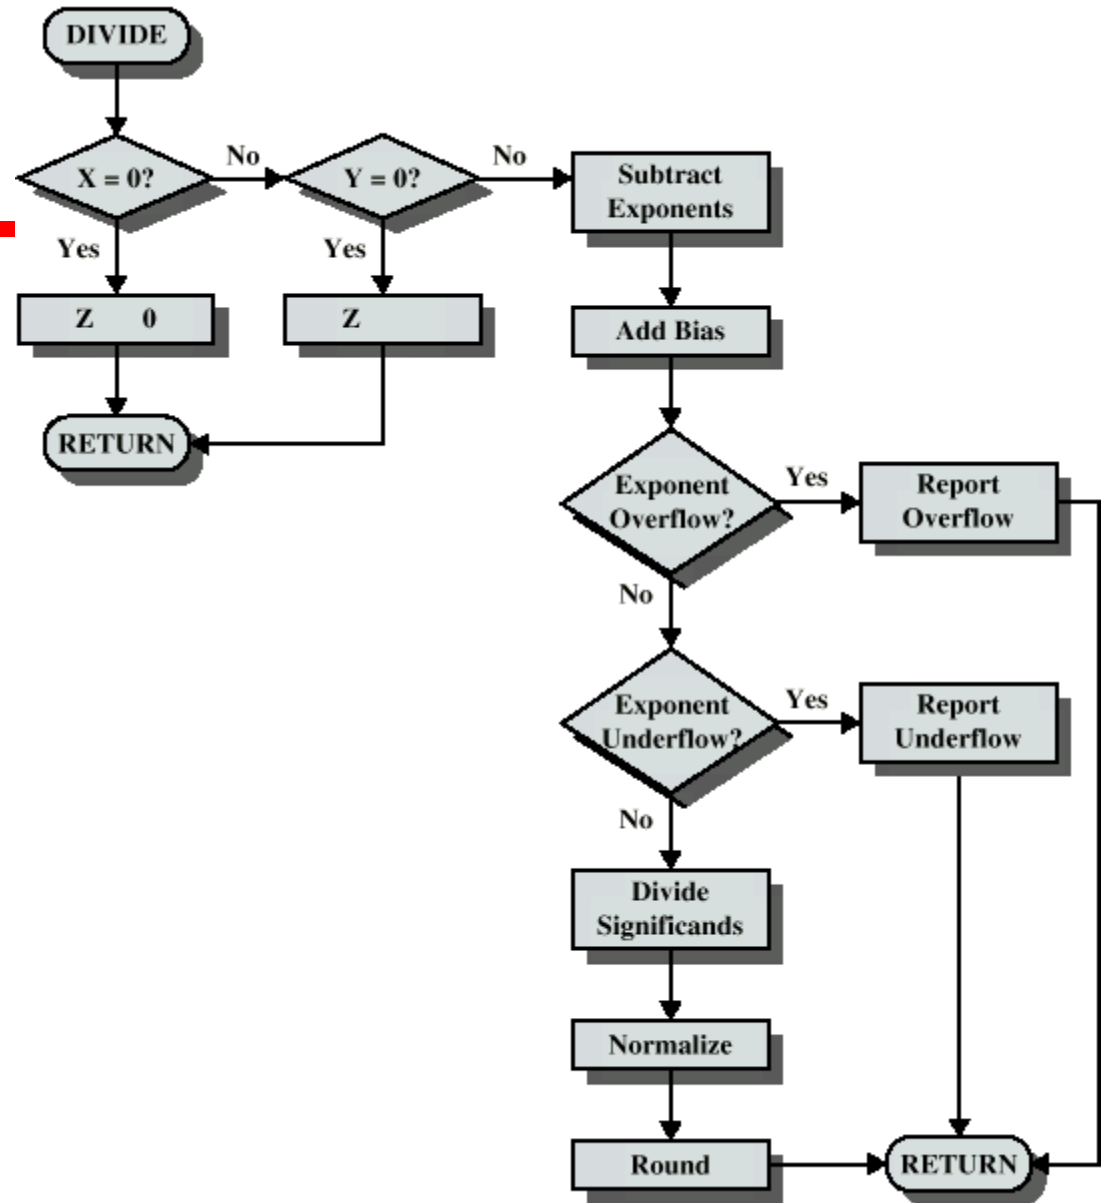

FP Arithmetic \times/\div

- ⌘ Check for zero
- ⌘ Add/subtract exponents
- ⌘ Multiply/divide significands (watch sign)
- ⌘ Normalize
- ⌘ Round
- ⌘ All intermediate results should be in double length storage

Floating Point Multiplication

Floating Point Division
